

Mechanical Jobs Facts

People who are into mechanical jobs need to be skilled with various equipments and machineries necessary in their kind of work. These are people who need to be familiar with how each machine and piece of equipment works to aid him in his work while avoiding possible injury or accidents since some mechanical work involves large and complicated machineries and their skillful use.

Where to find Mechanical Jobs

Mechanical employment can be found in automobile, manufacturing, industrial plants, construction sites, and large machinery facilities. Other general mechanics are self-employed and usually earn their keep per individual contract. The work usually involves installation, troubleshooting, repair, and maintenance of facility machineries. The people who are into this kind of work are also expected to create measures as well as perform such tasks that will prevent machinery malfunctions to avoid work delays and dangerous situations in the work areas where these machines are located and operated.

The security and upkeep of working tools as well as the creation and maintenance of work and repair logs are also responsibilities of people in a mechanical occupation. Writing down and supervising the strict implementation of standard operating procedures (SOPs) as well as of job safety analysis (JSAs) by other workers in the company is also an important responsibility. For the working areas, they are also expected to maintain the order and cleanliness to avoid accidents for all workers. Coordination with other workers related to the operation of the automobiles, tractors, and other machinery and equipment is another task in a mechanical work.

Requirements and Duties

Mechanical jobs are open to applicants who can read and understand simple instructions, must have basic knowledge of mathematics and calculations, and are expected to understand and interpret mechanical drawings. To be effective in a mechanical occupation, one also needs to have good eyesight and should be able to lift a weight of 100 pounds. This is because their kind of work usually involves large machineries or equipments that may need to be lifted, moved, or carried when actual mechanical work is done whether it is for repair or simple maintenance. Some examples of these are tractors, cars, mowers, water pumps, salt spreader, saw, and compactors. Some forms of maintenance include painting, cleaning, sanding, welding, and tune-ups.

A mechanical career is a good prospect for people who have high interests in how machinery and

equipment work, along with their repair and maintenance. Most employers need highly-skilled mechanics that have at least completed high school or its equivalent. A certification in Master Automobile Technician from the National Institute for Auto Service Excellence is required in most States before they can be hired by companies in these locations. Acquired years of experience working as an automobile mechanic or with other machineries also increases the chance for people who wish for a mechanical employment. But one must also be prepared to work forty hours or more each week which extends up to weekends and evenings. This is because their crucial work involves a lot of meticulous checking of the machines and equipments, usually during and after each work day.

Annual salaries earned from mechanical jobs vary by size of company or facility, by industry, location, experience, and qualifications. A July 2010 survey revealed an annual average salary of \$51,000 for a general mechanic. Often those who have earned five to ten years of experience are preferred by large companies or facilities and usually earn more. They are also more aware and highly effective in maintenance and repair work that seeks to avoid accidents or production cost losses that may otherwise cost a company thousands or even millions of dollars in losses.

Mechanics often work under the direct supervision of mechanical engineers, site supervisors, or operational managers. An effective and trustworthy mechanic who has earned several years of experience on the job may be able to build a mechanical career as a senior mechanic or even site supervisor. Their specialty in one specific mechanical job will also earn those people more opportunities for open positions in certain companies or facilities which seldom have mechanics that do not have their expertise.

People looking for a mechanical employment can check out different industries, automobile companies, industrial plants, manufacturing facilities, and construction sites which are in need of their mechanical skills and experience.
